Scale Excavator For Scale Test and Operator Training

Service
Brochure

LC recently completed the construction, installation and commissioning of a scale RH340 boom on the excavator at its Scale Test Rig Facility located at Goodna Technology Park, Queensland. This scale rig is the only one of its type in existence for excavator scale test and operator training.

The excavator includes full strain gauge and load sensor capability and the cab-mounted advanced data logger highlights optimal digging operations aimed at greater payload effectiveness and energy efficiency.

The scale excavator offers opportunity to gain high value return from the scale testing of various bucket types and configurations; this can be achieved through acquisition of data useful for bucket comparisons, digging operations and operator usage.

The scale rig provides an excellent platform for training in best practices.
